

92 inch ViP Interactive Foil™ provides touch interactivity for Aker Brygge

Visual Planet's ViP Interactive Foil™ impressively installed in a container near a harbour in the centre of Oslo, Norway – Aker Brygge, overlaying four 46" NEC LCD thin bezel monitors, with a 15mm gap between glass and monitor.

The innovative large format interactive display was a pilot project designed and applied by Back AS and Touch-It for the Coastal Society in Norway to provide the City's history and tourist information to those visiting the busiest shopping and business area in Oslo. Integrated with the four LCD screens the 92" ViP Interactive Foil™ was enclosed behind glass and protected from the harsh weather conditions on the harbour and robust demands of a high footfall location in Norway's capital.

The display software incorporated Google Maps and Adobe Flash programs whilst allowing users to add their own information via a multi-lingual web based interface consequently sharing points of interest, informative articles and pictures of their experiences.

This creative installation promoted the Jetty's surrounding area with attractive and inviting display technology whilst highlighting the ViP Interactive Foil's capability to interact with large audiences in any external environment.
